

.Hi Sir

I wrote omtenta for HTML-CSS , It was about Animal products compay that work with products for amimal so there are several types of animals and navigations bar that have

companysname, services, about us and contact they are clickable so they be clicked every one take to flex-card, there are flex-cards for every animals and last three flex-card for service, aboutus and .contact

All these flexcards are responsible for the size of screen when the screen is big enough the will be 2 columns and when the screen in size of mobile they will be only one column, I used only html and css with mediaquery, when the size of screen smaller then 480 px the flex-cards change to one .column unlas it be 2 columns

thanks
